Power System Modelling and Scripting Federico Milano, 2010-09-08 Power system modelling and scripting is a quite general and ambitious title. Of course, to embrace all existing aspects of power system modelling would lead to an encyclopedia and would be likely an impossible task. Thus, the book focuses on a subset of power system models based on the following assumptions: (i) devices are modelled as a set of nonlinear differential algebraic equations, (ii) all alternate-current devices are operating in three-phase balanced fundamental frequency, and (iii) the time frame of the dynamics of interest ranges from tenths to tens of seconds. These assumptions basically restrict the analysis to transient stability phenomena and generator controls. The modelling step is not self-sufficient. Mathematical models have to be translated into computer programming code in order to be analyzed, understood and “experienced”. It is an object of the book to provide a general framework for a power system analysis software tool and hints for filling up this framework with versatile programming code. This book is for all students and researchers that are looking for a quick reference on power system models or need some guidelines for starting the challenging adventure of writing their own code.

Formal to Practical Security Véronique Cortier, Claude Kirchner, Mitsuhiro Okada, Hideki Sakurada, 2009-05-14 The security issues set by the global digitization of our society have had, and will continue to have, a crucial impact at all levels of our social organization, including, just to mention a few, privacy, economics, environmental policies, national sovereignty, medical environments. The importance of the collaborations in the various fields of computer science to solve these problems linked with other sciences and techniques is clearly recognized. Moreover, the collaborative work to bridge the formal theory and practical applications becomes increasingly important and useful. In this context, and since France and Japan have strong academic and industrial backgrounds in the theory and practice of the scientific challenges set by this digitized world, in 2005 we started a formal French-Japanese collaboration and workshop series on computer security. The three first editions of these French-Japanese Computer Security workshops in Tokyo, September 5-7, 2005 and December 4-5, 2006 and in Nancy, March 13-14, 2008 were very fruitful and were accompanied by several important research exchanges between France and Japan. Because of this success, we launched a call for papers dedicated to computer security from its foundation to practice, with the goal of gathering together national versions of the rich set of papers and ideas presented at the workshops, yet opening the call to everyone interested in contributing in this context. This volume presents the selection of papers arising

from this call and this international collaboration.
